Software Requirements Specification

INTRODUCTION

1.1) Purpose

Our SRS document's primary purpose is to develop an animal shelter management system for animal shelters, rescue groups, and animal control facilities and manage their business operations efficiently and effectively while reducing friction in the pet adoption process.

1.2) Intended Audience and Reading Suggestions:

This database system primarily focuses on those people who are willing to adopt pets. With this database system, they will be able to see description of available pets and so this will help in finding a right pet for themselves. This database will also help owners of such pet shops and adoption centres in maintaining and making changes in such a huge data seamlessly. Also, developers and users who wish to know about our app compatibility could read this document to get a clear idea of our database system (you may skip over to the compatibility part if you only wish to know about the platforms supporting our database).

1.3) Product Scope:

Various businesses can widely use our system. It creates a helpful and easy-to-use environment for people looking for adopting pets and animal shelter groups taking care of animals. Animals that are lost or abandoned are kept in animal shelters while finding potential adopters to input data about themselves and be matched to a pet that fits their lifestyle.

It also maintains a database regarding the animal's essential characteristics like breed, color, age so that the buyer will have more convenience in finding his pet.

1.4) Description:

The product we are building is self-contained, the first one of its type that will store and manipulate the data of different shelter animals. It will be able to keep track of animals that have been rescued and also that the adopted ones.

Our product works on two bases, like providing shelter for animals and looking for adopters who are willing to adopt them.

The shelter wants to ensure that the necessary information is available to provide proper care to their animals.

The Database Management System will include many functionalities for the manager (owner) and customers.

The pets are divided into two categories:

- Ordered pets (Animals from Breeding Mills like puppy mills)
- Donated pets

We will categorize the animals to ease the process of finding the right pet like colour, age, breed and many more.

The following are the functionalities that are divided according to the designation:

Customers:

- View Customer Details.
 - Each customer can see his/her details with previous activities, like which pet they have adopted when they have adopted the pet etc.
- View Pet Details.
 - Customers can see every single detail of a particular animal like what is the age? What is its breed? etc.
- Sort the Pet based on preferences (like breed, gender, etc).
- Compare different Pets.
 - Customers can manually compare different pets for better selection.

- Edit Customer (own) Details.
 - Customers can edit its personal details like his/her postal Address, contact number etc.
 - Customers can edit only their personal data from their side to maintain integrity of data.

Manager:

- Managers are the people who are responsible to sell pets to the customer.
- Managers will require a Login ID and password to access the database.
- Managers can view the details of their customers as well as keep track of the pet he/she has sold the most.
- Managers can also easily see the amount of profit they made to date.
- Developers are people who keep track of the various trends regarding pets, suggest new functionalities, or change existing functionalities for the company's best interest.

Developer:

- A Developer will require a Login ID and a password to access the database.
- A Developer will have access to edit/add/remove functionalities from the current database.

Common Functionalities:

- The feature to sort the pets will be available to every type of customer, agent as well as the Developers.
- The feature to compare one pet with others will also be available to every customer, manager as well as the Developers.

The general idea of the **tables** and their **attributes** is given below:

The customers' table will have the following attributes: -

- Name
- Address
- Contact
- Email
- Liked animals
 - These are the general details that are required to fill by the customers for the identification purposes (if needed).

The Pet's table will have the following attributes: -

- Type
 - This field will show what type of animal it is. An aquatic animal, a canary, or a dog/cat.
- Breed
 - This field will give information about the breed of the animal (if it's a dog, the whether it's a pug or dalmatian)
- height
- weight
- age
- Description
 - This section will include all the meta-information about the pet animal like its food preferences, medication, ambient atmosphere, likes-dislikes, allergies, etc in brief
- Donated/ new
 - This category will justify whether the pet animal is ordered or stray so that customers can choose according to their preference.

General Functionalities:

- The database will be able to map every customer to the pets that they have bought which will help the Developer to identify which policies have higher selling rates as well as which policies need to be changed.
- A customer can view every pet that they have bought along with the details of the pet.

- To provide accurate information to customers regarding the available pets, database will be changed every week. So that customers don't miss out any important information as well as their liked pets.
- Before adopting a pet, customers will be provided important information regarding their liked pets and their cost as well as responsibilities required being a pet owner.
- The above thing will be a very useful tool for animals as well as the customers as performing it will help the owners to understand how it looks like being a pet owner and hence will decrease the number of pets being abandoned or returned.
- Moreover, new customers will also be provided the contact information of other customers to share their experience being a pet owner and the kind of responsibilities required so that they can be well-prepared.
- Also, a feedback type form can be provided to the past customers to share their experience and about the pet being friendly or not. This will further help the customers to decide which pet they should adopt according to their like.
- Customers can also provide donations in the form of animals or pet accessories such as medicines, cage, belts etc

General Process for customers to adopt a pet:

- Before adopting any pet, customers are required to have an account to access the database and look for their pets.
- If the customer is new then he would be urged to fill their details that will be stored in the customer table and hence their account will be created in which they could access the database with the login credentials they provided during their account sign-up.
- This information will further be stored in the customers table to help for future reference.

- Moreover, the customers are now provided the information regarding the pet. He can choose from the list of available pets (based on her liking and preferences).
- Finally, after choosing the right pet he/she is provided enough information about the respective pet i.e it's lifestyle, cage/house required, medication from the database provided in our schema.

General Process for customers to donate a pet/ pet accessories:

- Before donating any pet, customers are required to have an account to access the database and look for their pets.
- If the customer is new then he would be urged to fill their details that will be stored in the customer table and hence their account will be created in which they could access the database with the login credentials they provided during their account sign-up.
- This information will further be stored in the customers table to help for future reference.
- Moreover, the customers are now provided the information regarding the modes of donation. They can provide donations in the form of pet supplies like cage, pet food, cage etc. They can even donate some pet animals to the shelter for other customers to adopt it.
- The donated items will automatically get stored in the database.

FACT FINDINGS

2.1) Background Reading:

So, we went through the internet, finding various articles about animal shelters and pet shops (online modes) and got to know about its applications and the problems faced on which we can work on. We also got to know about the new ideas about how to increase and attract more customers. It summarizes the detailed information of the market segments based on different terms, such as strategy, scope, and manufacturing base. We also got to know that more and more people have started in adopting stray animals and take care of them, so we can attach a separate section for such animals. we also studied some databases which are somewhat similar to our agenda.

References:

- [Future Scope of Global Animal Shelter Management Software Market](#)
- [Adopting stray animals](#)
- [SRS EXAMPLE](#)
- [SRS TEMPLATE](#)
- [Advancements in Pet Databases](#)

Requirements:

- Currently, very unorganized data in adoption centres.
- There is a severe need for a database that can store and manage the data of all the animals like animal type, id, age, whether spayed or neutered, etc. in the shelter
- Organizers need to compete with others, and so they have to cope-up themselves with the technology
- The shelter wants to maximize their operational efficiency through increased information.
- Cage occupancy and dimensions also need to be managed.

2.2) Roleplay Interview:

- Interview 1:

System: Animal Shelter Management Database

Interviewee: Dhruv Chavda (Role Play)

Designation: Owner of Happy Paws pet shop and adoption centre.

Interviewer: 1) Darshil Rana
2) Sudarshan Kundnani

Designation: Student DAIICT
Designation: Student DAIICT

Date: 29/09/2020 **Time:** 12:30 PM

Duration: 35 minutes **Place:** Google Meet

Purpose of Interview:

Preliminary meeting to identify problems and requirements regarding Animal Shelter management System

Agenda:

Views on Current Animal Shelter Database Management System

Problems in the current system

Initial ideas

Suggestions

Documents to be brought to the interview:

Any documents relating to the current database management system.

Documents regarding the current working of the organization

Interview Summary (Interview 1):

System: Animal Shelter Management Database

Interviewee: Dhruv Chavda (Role Play)

Designation: Owner of Happy Paws pet shop and adoption centre.

Interviewer: 1) Darshil Rana
2) Sudarshan Kundnani

Designation: Student DAIICT
Designation: Student DAIICT

Date: 29/09/2020 **Time:** 12:30 PM

Duration: 35 minutes **Place:** Google Meet

Purpose of Interview:

During the whole interview, the main topic of discussion was to make our product completely helpful for the owner and release his burden for maintaining a considerable amount of data. Many suggestions were given from his side which was entirely on point, and we looked after it like data should be easy to manipulate, it should contain a wide range of information about animals, staff, and all.

The following are the main points discussed with the owner and manager of Happy Paws (Pet shop and adoption Center):

- The current data is very unordered. They require a system to store data systematically.
- Since the data is collected in the bookish form, it becomes difficult for them to maintain and change in times of need. The data in the system should be easy to manipulate.
- The system should be able to keep a wide range of information like general information of all the animals like breed, type, gender, age etc.
- There is a need for a separate section, especially for those who are being rescued or donated by the people who no longer need them.
- Customers Should be able to search and sort animals easily according to their preferences.

- Interview 2:

System: Animal Shelter Management Database

Interviewee: Chirag Patel (Role Play)

Designation: Developer of database (for Happy Paws pet shop and adoption center.)

Interviewer: 1) Sudarshan Kundnani
2) Darshil Rana

Designation: Student DAIICT
Designation: Student DAIICT

Date: 29/09/2020 **Time:** 12:30 PM

Duration: 35 minutes **Place:** Google Meet

Purpose of Interview:

Meeting, primarily to implement the requirements of the shop owner/ manager and any suggestions related to database.

Agenda:

About Current Animal Shelter Database Management System
flaws in the current data management system
How to create an improved data management system.
Ideas regarding Functionalities of the database
Suggestions

Documents to be brought to the interview:

Any documents relating to the current database management system.
Documents regarding the current working of the organization

Interview Summary (Interview 2):

System: Animal Shelter Management Database

Interviewee: Chirag Patel (Role Play)

Designation: Developer of database (for Happy Paws pet shop and adoption center).

Interviewer: 1) Sudarshan Kundnani
2) Darshil Rana

Designation: Student DAIICT
Designation: Student DAIICT

Date: 29/09/2020 **Time:** 12:30 PM

Duration: 35 minutes **Place:** Google Meet

Purpose of Interview:

The main topic of discussion was how to develop a database system to satisfy the requirements of the owner of the shop. We discussed about the different functionalities that can be added in this database which will ease the whole process and how to include a wide range of information about animals, staff, and all.

The following are the main points discussed with the developer:

- The current data is very unordered. The new system will store data in more ordered fashion.
- Once the database is created, the owner/manager should be able to change/edit the data inside the database.
- Functionalities regarding the sorting of animals based on user preferences should be implemented.
- There is a need for a separate section, especially for those who are being rescued or donated by the people who no longer need them.

2.3) Questionnaire:

1. Do you trust in getting pets of your choice online?
2. Which type of animal would you prefer to have as a pet?
3. Which age range would you prefer for your pet to be in?
4. Normally where do you prefer to get pets from?
5. Are you willing to adopt handicapped animals?
6. Would you consult anybody if you want to adopt a pet?
7. (follow-up) If yes, who will you consult?
8. Would you like to have more than 1 pet?
9. (follow-up) If yes, would they be of the same type?
10. If you get a chance to create an Animal Shelter management system, what features would you like to see?

We created a google form including the following questions and given below are the responses of it

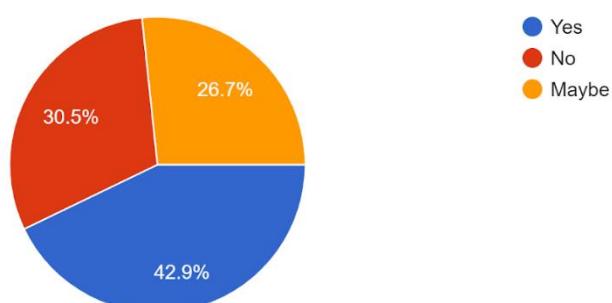

Link of the [Form](#)

Following were the responses:

1.

Do you trust in getting pets of your choice online?

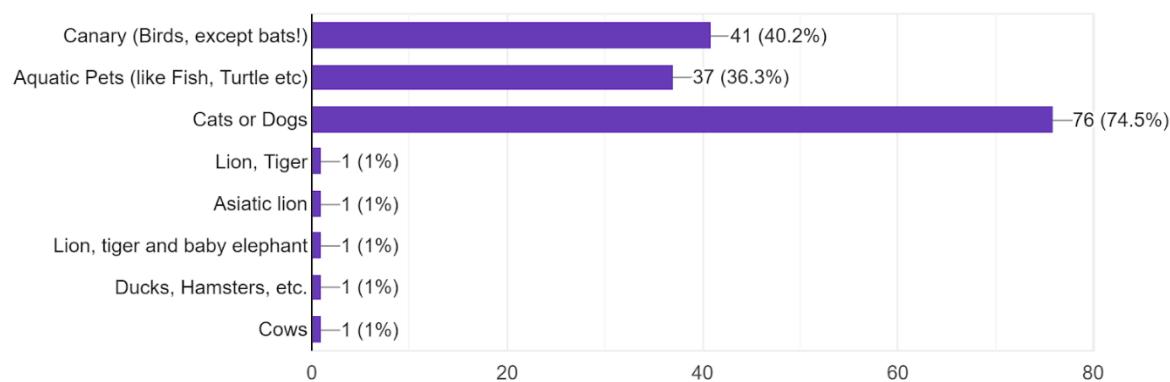

105 responses

2.

Which type of animal would you prefer to have as a pet?

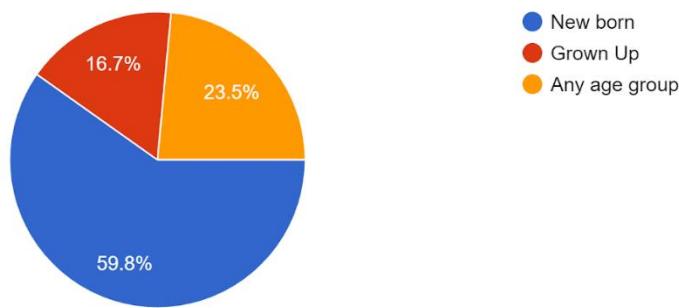

102 responses

3.

Which age range would you prefer for your pet to be in?

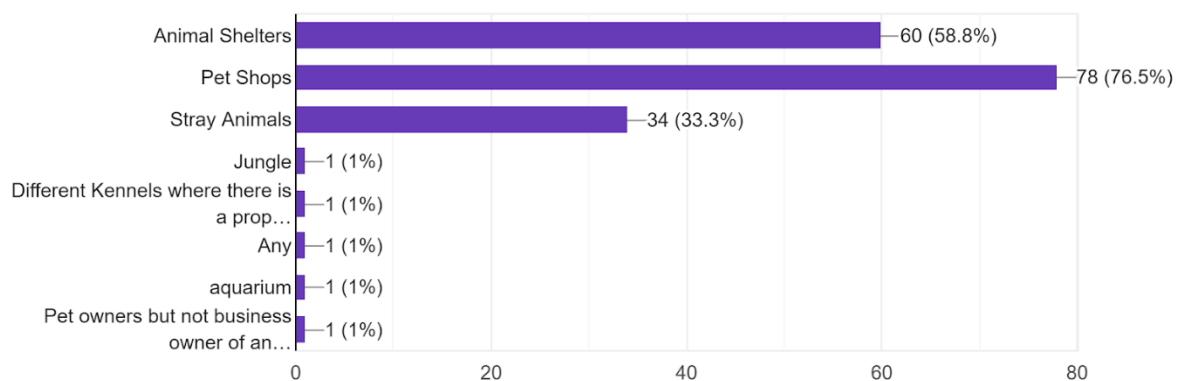

102 responses

4.

Normally where do you prefer to get pets from?

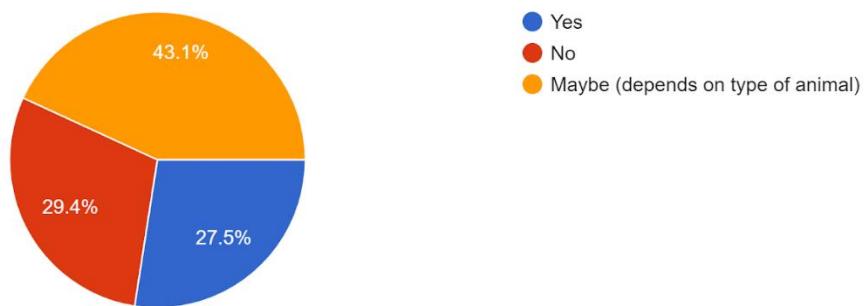

102 responses

5.

Are you willing to adopt handicapped animals?

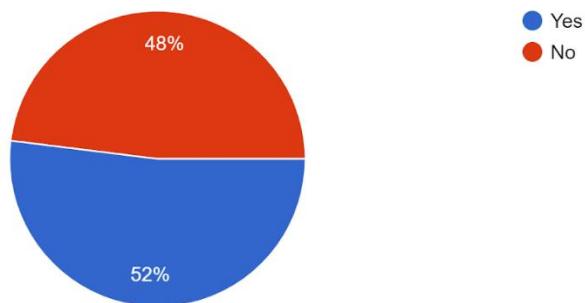

102 responses

6.

Would you consult anybody if you want to adopt a pet?

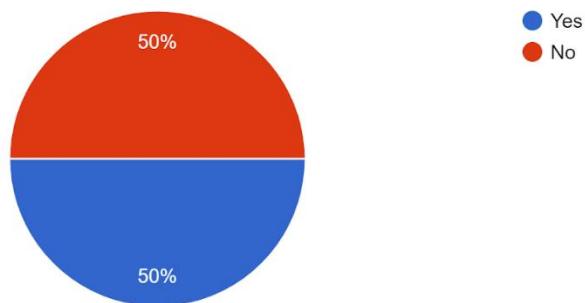

102 responses

8.

Would you like to have more than 1 pet?

102 responses

Survey for Animal Shelter Management System

The following are some questions regarding the database for an animal shelter. Please read them carefully and answer them appropriately.

*Required

Do you trust in getting pets of your choice online? *

Yes
 No
 Maybe

Are you willing to adopt handicapped animals? *

Yes
 No
 Maybe (depends on type of animal)

Which type of animal would you prefer to have as a pet? *

Canary (Birds, except bats)
 Aquatic Pets (like Fish, Turtle etc)
 Cats or Dogs
 Other: _____

Would you consult anybody if you want to adopt a pet? *

Yes
 No

Which age range would you prefer for your pet to be in? *

New born
 Grown Up
 Any age group

If yes, who will you consult?

Your answer _____

Would you like to have more than 1 pet? *

Yes
 No

If yes, would they be of the same type?

Your answer _____

Normally where do you prefer to get pets from? *

Animal Shelters
 Pet Shops
 Stray Animals
 Other: _____

If you get a chance to create an Animal Shelter Management system, what features would you like to see?

Your answer _____

If you get a chance to create an Animal Shelter Management system, what features would you like to see?

Your answer _____

Thank you for your time, woof! :)

2.4) Observations

- The majority of the public did not have any problems in online mode.
- Most of the people like Cats and dogs followed by canary and aquatic pets. We concluded that thinking of aquatic animals as pets would be financially high as it requires more care and proper equipment for need.
- Around 60% of the public would like to have a new born pet which was as per expectation as new-borns are the cutest ones.
- Almost $\frac{3}{4}$ th of the responses were of the view to buying a pet from a pet shop. We found it very surprising that nearly $\frac{1}{3}$ rd of the public were not reluctant to have a stray animal as a pet.
- Marjory finds no issues in having a handicapped pet.
- Almost equal people were in favour of consulting someone before buying a pet. They would probably like to consult someone who has the same type of pet they wanted to have.
- Half of the people wanted to have more than one pet and probably of different types.
- Regarding the different features that a user would like to have in their system, we found that people would like to have a proper record of the animals, lots of pictures with descriptions like age, weight, gender, breed etc.

Fact Finding Chart:

Objectives	Techniques	Subjects	Time Commitment
To get an overview of current trends in the Animal Shelter Database Management System	Background Reading	News Articles and Websites	1 Day
To get an idea what features we can include to overcome current liabilities	Interview	Owner of pet shop (Roleplay)	35 Minutes
	Interview	Manager of pet shop (Roleplay)	35 Minutes
To Establish what records and resources are kept	Interview/ Document Sampling	Resource Manager	2 Hours
Data Analysis of customers	Questionnaire (Using Google Forms)	Public Survey	2 Days
Functionalities that customers want in the interface of the system	Questionnaire (Using Google Forms)	Public Survey	2 Days

Requirements

Based on Interviews

- An easy to use Database Management System (Frequency = 2)
- Features to compare and sort based on different required characteristics (Frequency = 2)
- Edit Pet and Customer Details (Frequency = 2)
- Customers can view their History (Frequency = 1)

Based on Google Forms:

- Customers can view the available animals and their characteristics
- There should be an online mode of transaction.
- Pics and a short description of available animals are highly requested.

Almost 75% of the people would be able to take a better decision of having an animal as a pet if they have their pictures.

Schema Overview:

- *covering only main relations.*

For more reference visit “Final DDL Scripts”

- **Animal**
 - id (primary)
 - shelter id (foreign key)
 - type_id (foreign key)
 - breed_id (foreign key)
 - height,
 - weight,
 - skin color,
 - age,
 - rate,
 - cage size
 - description (food preferences and medications)
- **Animal_type**
 - name
 - id (primary)
- **Breed**
 - name
 - id (primary)

- User
 - Name
 - ID (primary)
 - (address
 - contact
 - email)
- Adoption
 - id
 - user (foreign key)
 - animal (foreign key)
 - date of adoption
 - Payment mode
- Donation
 - id
 - user (foreign key)
 - animal (foreign key)
 - date of donation
 - donation info

User Classes and Characteristics:

Customers

- To view various animals that are currently available.
- Customers can watch their past actions/activities.
- View-only mode

Owner / Manager (Admin)

- To view details of his/her customer.
- Animal records
- To change/edit characteristics of animals.
- To delete/edit data of animals that unavailable (or sold).
- Can manipulate the database

Developer

- To edit/change functionalities of the database.
- To add/remove policies and norms.
- To edit/view details of new animals.
- Maintains the database

Operating Environment:

Software Requirements

- Operating System: Windows
- Database System: PostgreSQL

Hardware Requirements

- Computer with working internet connectivity

External Interface Requirement

- Databases of animals present in the shelter

Product Functions

- Add/Remove/Edit data of animals and customers from the database.
- View Customer Details.
- View Pet Details.
- Sort the Pet based on preferences (like breed, gender etc).
- Compare different Pets.
- Edit Customer Details.
- Edit Pet Details.
- Adopt a pet
- Donate a pet
- Buy Pet Accessories

Assumptions

- Customers/ Staff have a basic knowledge of using a computer.
- Database will be operated only by a staff member of the shelter
- Customer Details and Animal details are not Fake.
- We have access to Animal Database of the shop.
- Only admin will be able to change the Functionalities of the database

Privileges

Functions	Customer	Admin	Developer
View Pet Details	Yes	Yes	Yes
View Customer Details	Yes	Yes	Yes
Sort the Pet based on preferences (like breed, gender etc).	Yes	Yes	Yes
Compare different Pets	Yes	Yes	Yes
Edit Pet Details	No	Yes	Yes
Edit Customer Details	No	Yes	Yes
To edit/change functionalities of the database.	No	No	Yes
To add/remove policies and norms	No	No	Yes

Business Constraints

- There will be a time constraint since we have to develop the Database System in a short span.
- Since we have to start the project from the complete base, we have to carefully think of features that are to be included that will facilitate the system management but will eventually lead to higher cost.
- The old data needs to be migrated to the new Database
- The maintenance of the new Database will also cost based on the required additional features or optimization.
- A Developer will require if you want to change functionalities of the database.

- Pet_Accessories (Shelter_ID, item, quantity, price)

Section 5

Normalization and Schema Refinement

List of Redundancies

No redundancies found.

List of Anomalies

No Anomalies found.

Normalization

1NF

Description and medication attributes were multi-valued attributes for relations “animal” and “breed” respectively. These multi-valued attributes violate first normal form. So, the good idea is to create a separate table and push multivalued attribute into it.

2NF

No changes were required since there are no partial dependencies. The tables with composite PKs have no other non-primary attribute dependent on PK.

3NF

There are no Transitive Dependencies and hence the database is in 3NF.

Section 6

SQL

Final DDL Scripts

Animal

```

SQL Queries

Easy Queries:

1) List the contact numbers of workers of all shelters

SQL QUERY:

```
select name,contact_number from staff
where position like 'workers'
```

```
1 select name,contact_number from staff
2 where position like 'workers'
```

	name	contact_number
1	Dixie Hollyland	992531101
2	Driren Beswetherick	4497553477
3	Gilberte Eastmond	7723776373
4	Alikee Corpe	453021085
5	Sidnee Poyer	7028929833
6	Bronnie Vlasenko	2445869455
7	Fitzgerald Bassilashvili	3779719837
8	Joey Grigoli	5781487492

2) List down all the male animal from the shelter 2:

SQL QUERY:

```
select * from animal where shelter_id=2 and gender like 'Male'
```

The screenshot shows the pgAdmin 4 interface. On the left, the 'Browser' pane displays the database schema with tables like 'animal', 'customer', and 'breed'. The 'Query Editor' pane contains the SQL query: 'select * from animal where shelter_id=2 and gender like 'Male''. The 'Data Output' pane shows the results of the query, which are listed below.

	id	shelter_id	type	breed_type	age	height	weight	rate	gender	colour
1	3	2	2	7	14	23.3	4.22	4100	Male	Golden
2	10	2	1	3	16	67.75	27.23	2100	Male	Brown
3	12	2	4	21	4	NULL	2300	Male	Orange	
4	25	2	3	13	5	NULL	1.38	2500	Male	Maroon
5	31	2	3	16	12	NULL	2.62	2800	Male	Indigo
6	44	2	4	18	5	NULL	2600	Male	Green	
7	65	2	2	9	4	21.58	2.12	3700	Male	Black

3) List all animals with height greater than 20cm and weight less than 10kg

SQL QUERY:

```
select * from animal where height>20 and weight<10
```

```

Data Output Explain Messages Notifications

	id [PK] integer	shelter_id integer	type integer	breed_type integer	age integer	rate integer	gender character varying (10)	colour character varying (15)	cage_size character varying (3)	height double precision
1	3	2	2	7	14	4100	Male	Golden	L	
2	6	2	2	11	5	2100	Female	Cream	M	
3	11	5	2	8	7	2600	Female	Black	L	
4	14	4	2	9	10	3000	Female	Cinnamon	XL	
5	38	1	2	10	7	3100	Male	White	S	
6	41	3	2	7	6	2600	Male	Cinnamon	S	
7	47	4	2	11	5	2500	Female	Golden	XL	

4) Count the number of each type of animals from shelter 1

SQL QUERY:

```
select animal_type.name , count(*)
from animal,animal_type
where animal.type=animal_type.id and animal.shelter_id=1
group by animal_type.name
```

The screenshot shows the pgAdmin 4 interface. On the left, the object browser displays a database named '201801225_00' containing an 'Animal_Shelter' schema with various tables like 'adoption', 'animal', etc. The 'animal' table is selected, showing its 11 columns: id, shelter_id, type, breed_type, age, height, weight, rate, gender, colour, cage_size. The central area is the Query Editor with the following SQL code:

```
1 select animal_type.name , count(*)
2 from animal,animal_type
3 where animal.type=animal_type.id and animal.shelter_id=1
4 group by animal_type.name
5
```

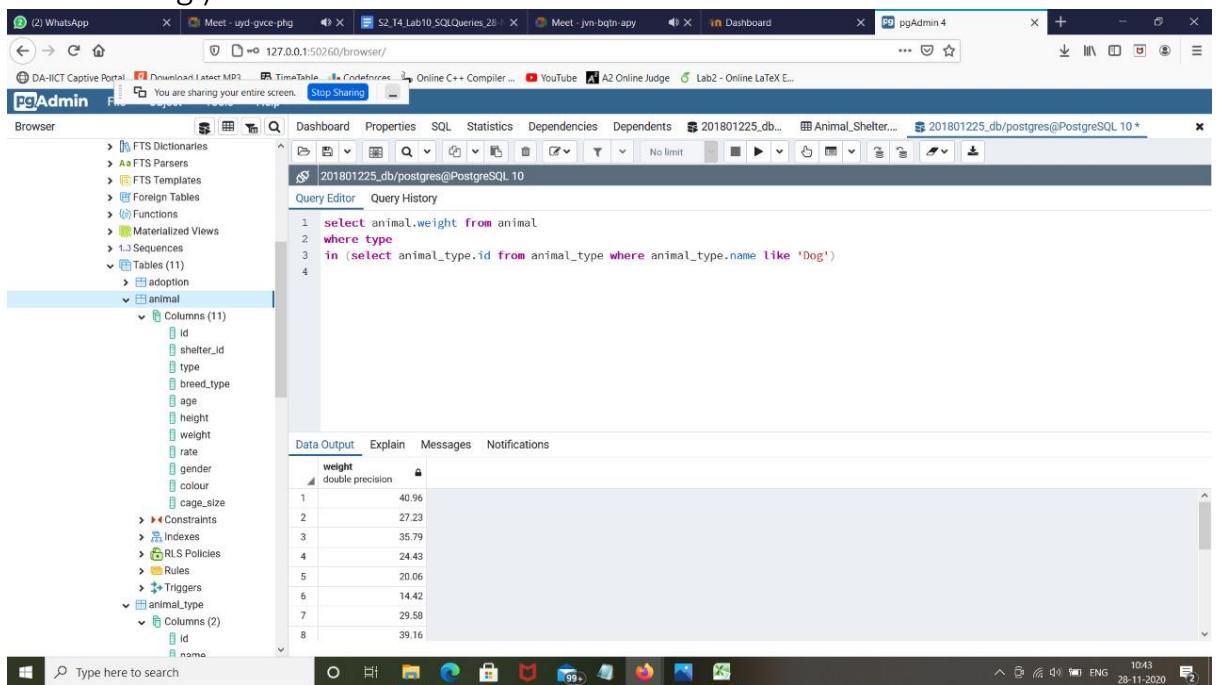

Below the editor is the Data Output tab, which displays the results of the query:

	name	count
1	cat	5
2	bird	4
3	fish	8
4	Dog	5

5) Display the weights of all dogs

SQL QUERY:

```
select animal.weight from animal
where type in
    (select animal_type.id from animal_type where animal_type.name
like 'Dog')
```

The screenshot shows the pgAdmin 4 interface. The left sidebar displays the database schema with tables like 'animal' and 'animal_type'. The main area is the Query Editor with the following SQL code:

```
1 select animal.weight from animal
2 where type
3 in (select animal_type.id from animal_type where animal_type.name like 'Dog')
4
```

The Data Output tab shows the results:

	weight
1	40.96
2	27.23
3	35.79
4	24.43
5	20.06
6	14.42
7	29.58
8	39.16

6) List all the animal details whose age is less than the average age

SQL QUERY:

```
select * from animal where age < (select avg(age) from animal)
```

The screenshot shows the pgAdmin 4 interface. On the left, the object browser displays the database schema with the 'animal' table highlighted. The main window contains the SQL query:

```
1 select * from animal where age < (select avg(age) from animal)
```

The Data Output tab shows the results of the query:

	id	shelter_id	type	breed_type	age	rate	gender	colour	cage_size	height
5	9	3	4	19	5	2100	Male	Red	S	
6	11	5	2	8	7	2600	Female	Black	L	
7	12	2	4	21	4	2300	Male	Orange	S	
8	15	3	1	5	7	3600	Male	Black	L	
9	17	5	4	18	2	2500	Male	Green	M	
10	19	4	1	3	4	4300	Male	Maroon	XL	
11	22	2	4	19	3	2400	Male	Green	M	

7) Count the number of workers in different position of staff of shelter 5

SQL QUERY:

```
select count(*),position from staff
where shelter_id=5
group by position
```

```
201801225.db/postgres@PostgreSQL 10*
```

count	position
1	owner
2	workers
3	manager
4	developer

8) List all the details of pet accessories in shelter 3

SQL QUERY:

```
select * from pet_accessories
where shelter_id=3
```

The screenshot shows the pgAdmin 4 interface with a query editor window. The query is:

```
1 select * from pet_accessories
2 where shelter_id=3
```

The results are displayed in a Data Output table:

	shelter_id	item	quantity	price
1	3	food packets	15	500
2	3	belts	7	450
3	3	medicines	13	200
4	3	cage	15	1000

9) List all names of developers for all shelters

SQL QUERY:

```
select shelter_id, name from staff
where position like 'developer'
order by shelter_id
```

```
1 select shelter_id, name from staff
2 where position like 'developer'
3 order by shelter_id
```

shelter_id	name
4	Tim Horbath
5	Krystalle Peisk
6	Bastian Raper
7	Marge Saint
8	Theda Hutchinson
9	Bernard Hebard
10	Stinky Bagshaw
11	Haillee Veall

10) List all the customers whose name start with L

SQL QUERY:

```
select * from customer
where first_name like 'L%'
```

The screenshot shows the pgAdmin 4 interface with a query editor window. The query is:

```
select * from customer
where first_name like 'L%'
```

The results table displays the following data:

	id	first_name	last_name	email	address	contact_number
1	11	Lyndsey	Grandin	lgrandina@shop-pro.jp	75999 Hoepler Terrace	4639602154
2	43	Levin	Rainbow	lrainbow15@independent.co.uk	96400 Laurel Place	336874034
3	50	Lindsay	McCafferty	lmccafferty1d@ted.com	6147 Len Street	1316310485
4	81	Laney	Crosbie	lcrosbie28@dition.ne.jp	058 Johnson Center	4491359490

11) List the count of animals in all shelters

SQL QUERY:

```
select shelter_id,count(*) from animal
group by shelter_id
```

The screenshot shows the pgAdmin 4 interface. In the left sidebar, under the 'Tables (11)' section, the 'animal' table is selected. The 'Columns (11)' section lists the columns: id, shelter_id, type, breed_type, age, height, weight, rate, gender, colour, and cage_size. The main area shows the SQL query:

```
1 select shelter_id, count(*) from animal
2 group by shelter_id
3
```

The 'Data Output' tab displays the results:

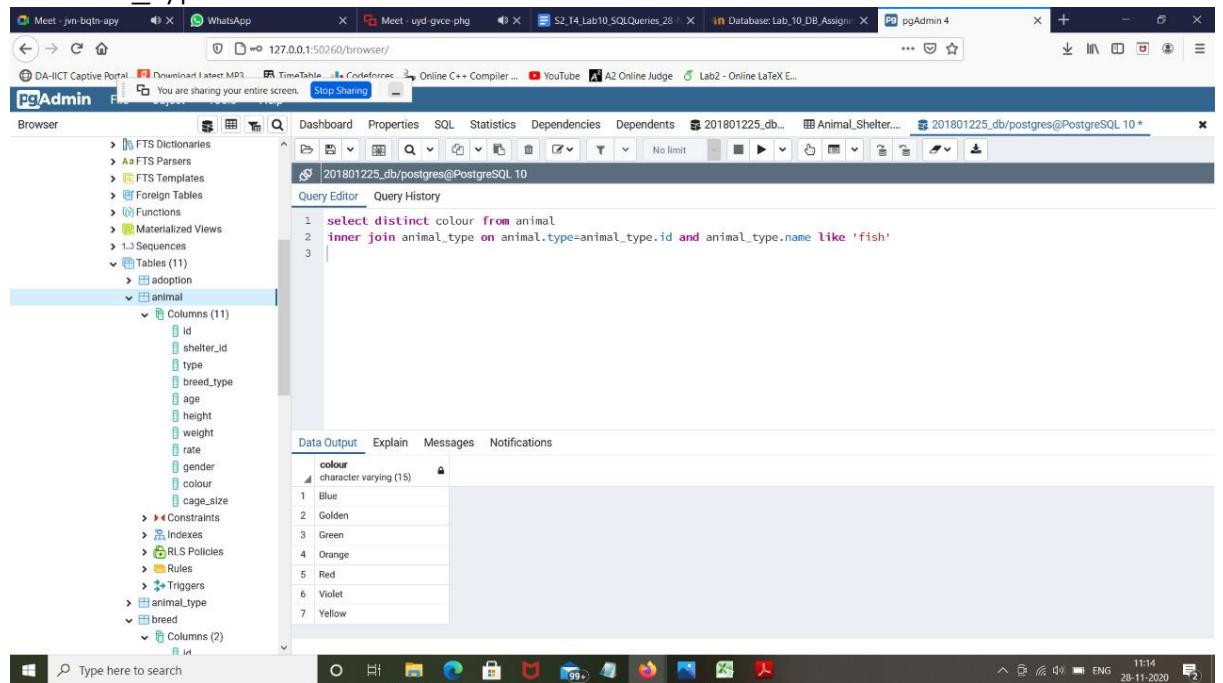

shelter_id	count
1	22
2	27
3	16
4	16
5	19

Medium Queries:

12) List the colours of all fishes

SQL QUERY:

```
select distinct colour from animal
inner join animal_type on animal.type=animal_type.id and
animal_type.name like 'fish'
```

The screenshot shows the pgAdmin 4 interface with a query editor window. The query is:

```
1 select distinct colour from animal
2 inner join animal_type on animal.type=animal_type.id and animal_type.name like 'fish'
3
```

The results pane displays the following data:

colour
character varying (15)
1 Blue
2 Golden
3 Green
4 Orange
5 Red
6 Violet
7 Yellow

13) List the shelters whose belts quantities are greater than the average of all quantities of belts.

SQL QUERY:

```
select shelter_id from pet_accessories where
    quantity > (select avg(quantity) from pet_accessories where
        item like 'belts')
and item like 'belts'
```

The screenshot shows the pgAdmin 4 interface. In the left sidebar, under the 'Tables' section, 'pet.accessories' is selected, revealing its columns: shelter_id, item, quantity, and price. The main area is the 'Query Editor' containing the following SQL code:

```
1 select shelter_id from pet_accessories where
2     quantity > (select avg(quantity) from pet_accessories where item like 'belts')
3 and item like 'belts'
```

The 'Data Output' tab shows the result of the query:

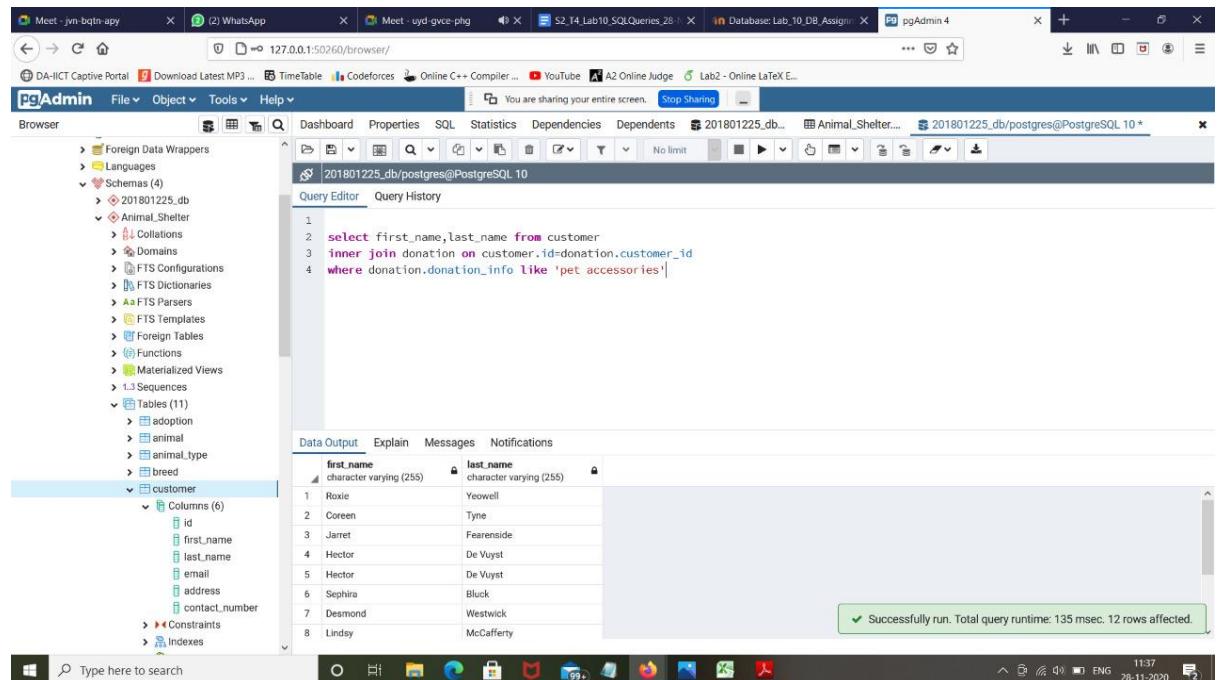

shelter_id
2

A green success message at the bottom right of the results pane states: "Successfully run. Total query runtime: 176 msec. 1 rows affected."

14) List customers name who have donated pet accessories

SQL QUERY:

```
select first_name,last_name from customer
inner join donation on customer.id=donation.customer_id
where donation.donation_info like 'pet accessories'
```

```
1
2 select first_name,last_name from customer
3 inner join donation on customer.id=donation.customer_id
4 where donation.donation_info like 'pet accessories'|
```

	first_name	last_name
1	Roxie	Yeowell
2	Coreen	Tyne
3	Jarret	Fearnside
4	Hector	De Vuyst
5	Hector	De Vuyst
6	Sephira	Bluck
7	Desmond	Westwick
8	Lindsay	McCafferty

Successfully run. Total query runtime: 135 msec. 12 rows affected.

15) List the breed names whose veterinarian is Darhshil

SQL QUERY:

```
select breed.name from breed
inner join medication on medication.breed_id=breed.id
where veterinarian like 'Darhshil%'
```

```
201801225_db/postgres@PostgreSQL_10
```

```
1
2
3 select breed.name from breed
4 inner join medication on medication.breed_id=breed.id
5 where veterinarian like 'Darhshil%'
```

name
persian cat
bengal cat
british shorthair
bombay cat
siberian cat
cockatiels

16) List the breeds of animals with cage size L

SQL QUERY:

```
select distinct name from breed
inner join animal on animal.breed_type = breed.id
where animal.cage_size like 'L'
```

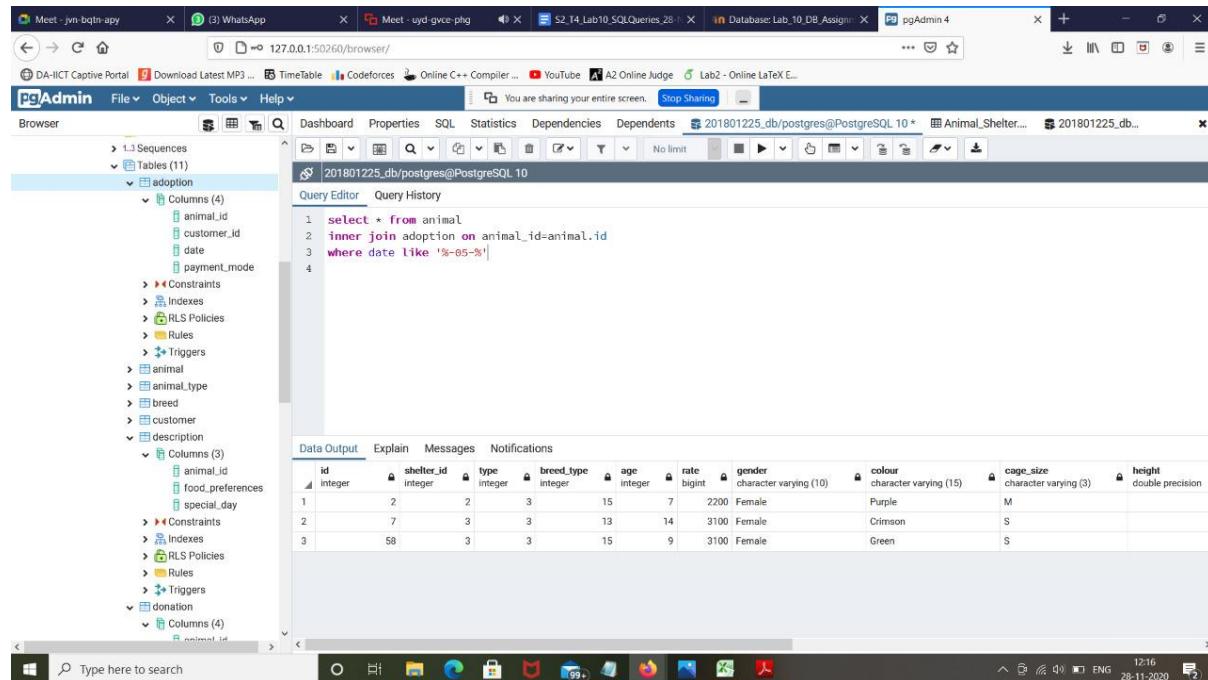

```
201801225_db/postgres@PostgreSQL 10
```

name
golden retriever
gold fish
siberian cat
Platies
parrotlets
tortoise
persian cat
Oscar

17) List the details on animals who were adopted in May month in this year

SQL QUERY:

```
select * from animal
inner join adoption on animal_id=animal.id
where date like '%-05-%'
```

The screenshot shows the pgAdmin 4 interface with the following details:

- Browser:** Shows the database structure with tables like adoption, animal, animal_type, breed, customer, and description.
- Query Editor:** Contains the SQL query:

```
1 select * from animal
2 inner join adoption on animal_id=animal.id
3 where date like '%-05-%'
```
- Data Output:** Displays the results of the query as a table:

	id	shelter_id	type	breed_type	age	rate	gender	colour	cage_size	height
1	2	2	3	15	7	2200	Female	Purple	M	
2	7	3	3	13	14	3100	Female	Crimson	S	
3	58	3	3	15	9	3100	Female	Green	S	

18) List the date on which maximum donation was done

SQL QUERY:

```
select count(*),date from donation
group by date
order by count desc
limit 1
```

The screenshot shows the pgAdmin 4 interface. In the left sidebar, under 'Tables (11)', the 'adoption' table is selected, showing its columns: animal_id, customer_id, date, and payment_mode. The main area displays the following SQL query in the 'Query Editor':

```
1 select count(*),date from donation
2 group by date
3 order by count desc
4 limit 1
```

Below the query, the 'Data Output' tab shows the results:

	count	date
1	1	10-09-2020

19) Count the total number of staff for all shelters

SQL QUERY:

```
select shelter_id, count(*) from staff  
group by shelter_id
```

Successfully run. Total query runtime: 187 msec. 5 rows affected.

20) Give the position and the shelter_id for Tim

SQL QUERY:

```
select position,shelter_id from staff  
where name like 'Tim%'
```

The screenshot shows the pgAdmin 4 interface. In the top navigation bar, there are several tabs and icons. The main area is the Query Editor, which contains the following SQL code:

```
1 select position,shelter_id from staff  
2 where name like 'Tim%'
```

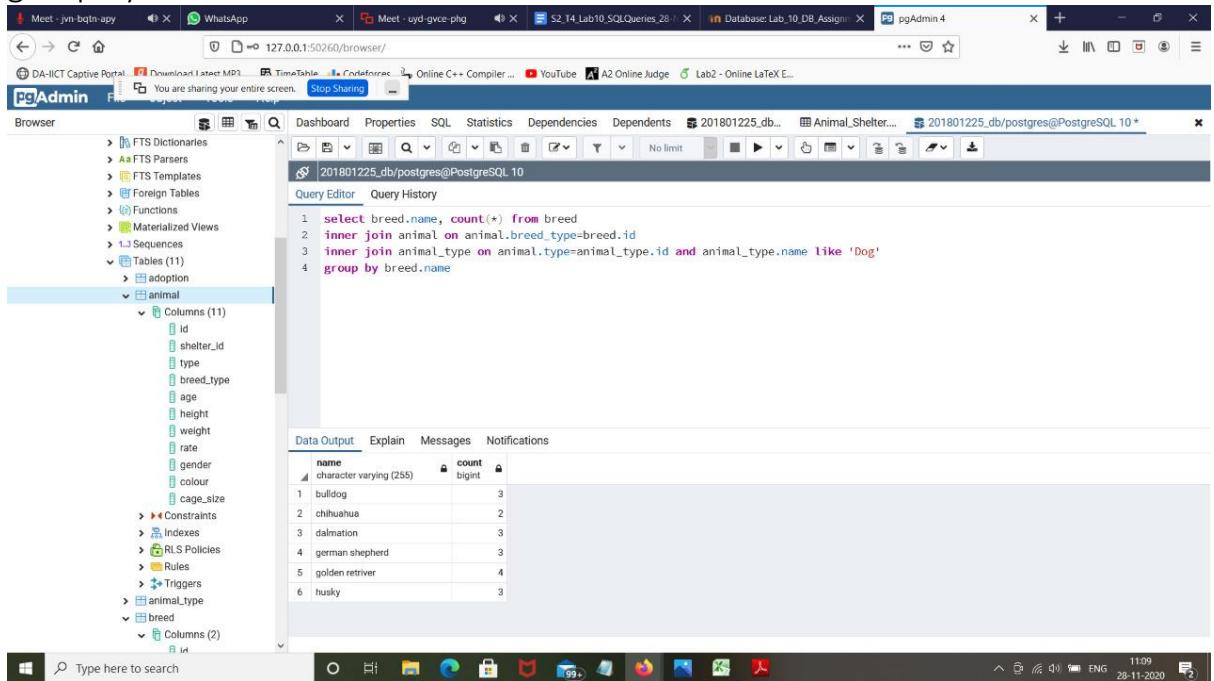

Below the code, the Data Output tab is selected, showing the results of the query:

position	shelter_id
character varying (50)	integer
1 developer	1

21) List the breeds and it's count of dogs

SQL QUERY:

```
select breed.name, count(*) from breed
inner join animal on animal.breed_type=breed.id
inner join animal_type on animal.type=animal_type.id and
animal_type.name like 'Dog'
group by breed.name
```

The screenshot shows the pgAdmin 4 interface with a query editor window. The query is:

```
1 select breed.name, count(*) from breed
2 inner join animal on animal.breed_type=breed.id
3 inner join animal_type on animal.type=animal_type.id and
4 animal_type.name like 'Dog'
5 group by breed.name
```

The results are displayed in a table:

name	count
bulldog	3
chihuahua	2
dalmation	3
german shepherd	3
golden retriever	4
husky	3

22) List all the breeds of fishes

SQL QUERY:

```
select breed.name from breed
inner join animal on animal.breed_type=breed.id
inner join animal_type on animal.type=animal_type.id and
animal_type.name like 'fish'
group by breed.name
```

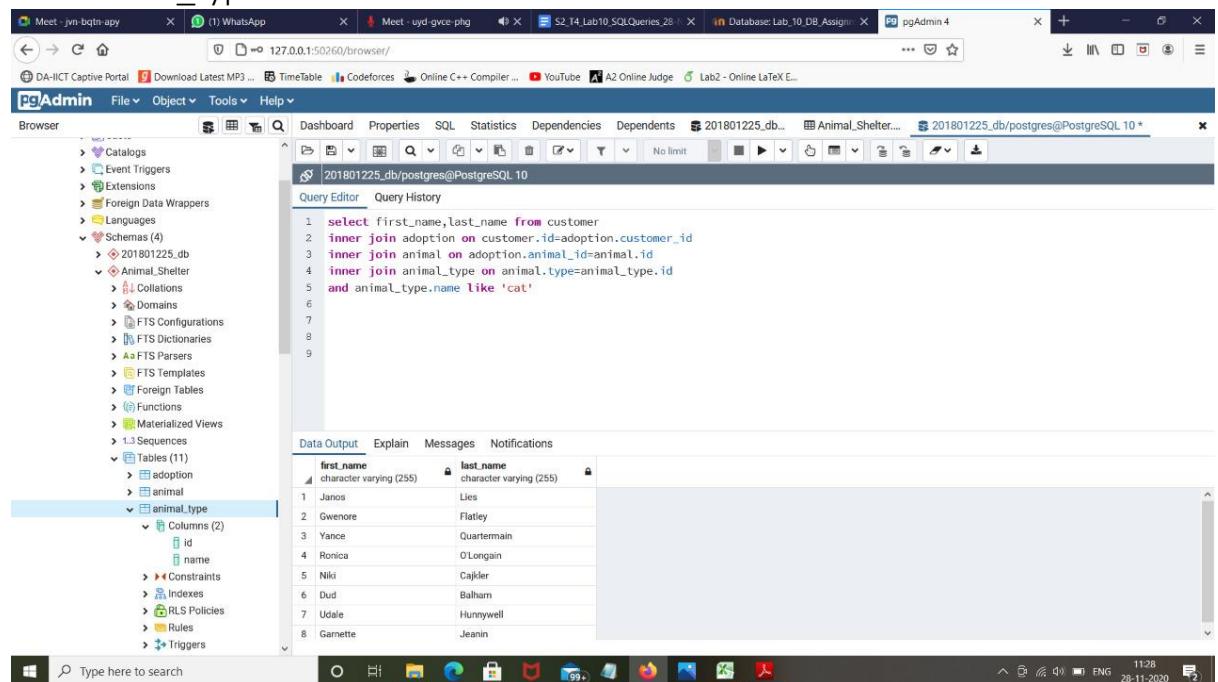

```
201801225_db/postgres@PostgreSQL 10
Query Editor Query History
1 select breed.name from breed
2 inner join animal on animal.breed_type=breed.id
3 inner join animal_type on animal.type=animal_type.id and animal_type.name like 'fish'
4 group by breed.name
```

name
gold fish
Guppies
Oscar
Platies
tortoise

23) List all customers name who have adopted cat

SQL QUERY:

```
select first_name,last_name from customer
inner join adoption on customer.id=adoption.customer_id
inner join animal on adoption.animal_id=animal.id
inner join animal_type on animal.type=animal_type.id
and animal_type.name like 'cat'
```

The screenshot shows the PgAdmin 4 interface with the following details:

- Browser:** Shows the database structure with Schemas (4) expanded, revealing 201801225_db, Animal_Shelter, and animal_type.
- Query Editor:** Contains the SQL query:

```
1 select first_name,last_name from customer
2 inner join adoption on customer.id=adoption.customer_id
3 inner join animal on adoption.animal_id=animal.id
4 inner join animal_type on animal.type=animal_type.id
5 and animal_type.name like 'cat'
```
- Data Output:** Displays the results of the query as a table:

	first_name	last_name
1	Janos	Lies
2	Gwenore	Flatley
3	Yance	Quartermain
4	Ronica	O'Longain
5	Niki	Cajder
6	Dud	Balham
7	Udale	Hunnywell
8	Garnette	Jeanin

24) List the breeds of animals who likes to eat Meat

SQL QUERY:

```
select breed.name from breed
inner join animal on animal.breed_type=breed.id
inner join description on animal.id=description.animal_id
where food_preferences like 'Meat'
```

The screenshot shows the PgAdmin 4 interface with a query editor window. The browser pane on the left displays a tree view of database objects, including tables like adoption, animal, animal_type, breed, customer, description, donation, medication, pet_accessories, and sequences. The query editor contains the following SQL code:

```
1 select breed.name from breed
2 inner join animal on animal.breed_type=breed.id
3 inner join description on animal.id=description.animal_id
4 where food_preferences like 'Meat'
```

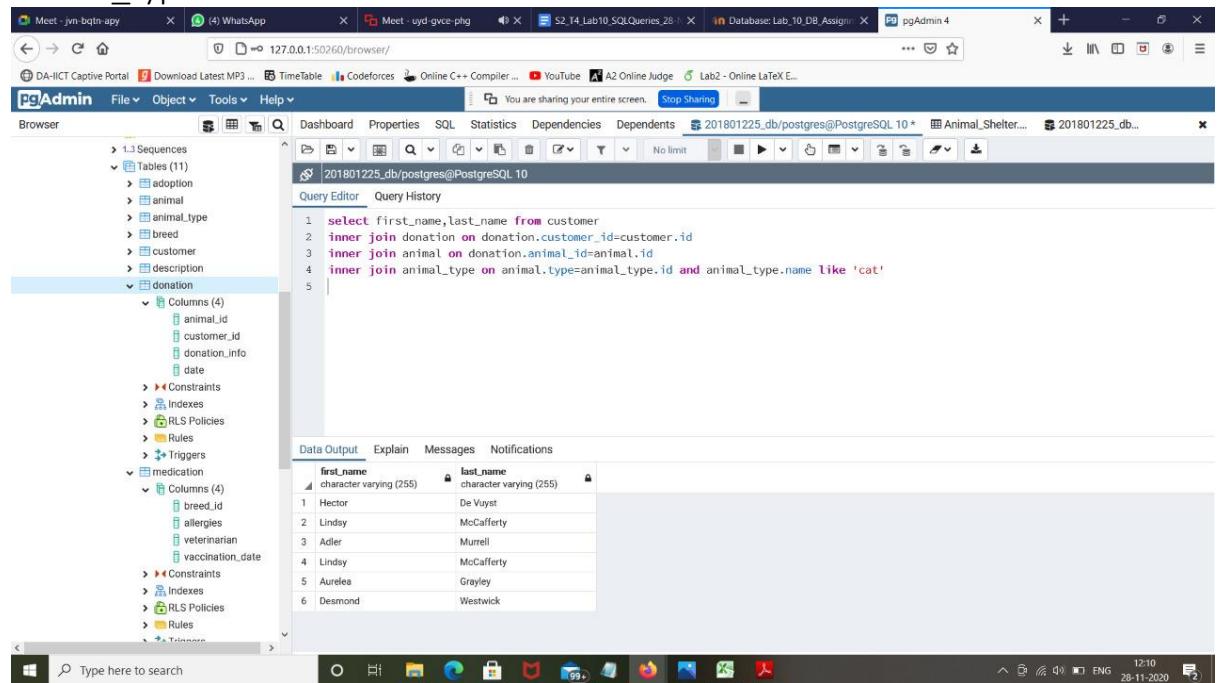

The results pane shows the output of the query, listing the names of the breeds:

name
cockatiels
persian cat
husky
Oscar
bengal cat
british shorthair
husky
parrotlets

25) List all customers name who have donated cats

SQL QUERY:

```
select first_name,last_name from customer
inner join donation on donation.customer_id=customer.id
inner join animal on donation.animal_id=animal.id
inner join animal_type on animal.type=animal_type.id and
animal_type.name like 'cat'
```

The screenshot shows the pgAdmin 4 interface with a query editor window. The query is:

```
1 select first_name,last_name from customer
2 inner join donation on donation.customer_id=customer.id
3 inner join animal on donation.animal_id=animal.id
4 inner join animal_type on animal.type=animal_type.id and animal_type.name like 'cat'
5
```

The results are displayed in a Data Output tab:

first_name	last_name
Hector	De Vuyst
Lindsay	McCafferty
Adler	Murrell
Lindsay	McCafferty
Aurelia	Grayley
Desmond	Westwick

26) List all the details of male cat with cage size L

SQL QUERY:

```
select * from animal
inner join animal_type on animal_type.id =animal.type
and animal.gender like 'Male'
and animal.cage_size like 'L'
and animal_type.name like 'cat'
```

The screenshot shows the PgAdmin 4 interface. On the left, the 'Browser' pane displays the database schema, including tables like 'animal' and 'animal_type'. The 'Query Editor' pane contains the SQL query provided above. The 'Data Output' pane shows the results of the query, which are as follows:

	id	shelter_id	type	breed_type	age	rate	gender	colour	cage_size	height
1	3	2	2	7	14	4100	Male	Golden	L	
2	72	1	2	9	7	4100	Male	Cinnamon	L	
3	73	3	2	11	12	2300	Male	Red	L	
4	91	1	2	3	7	2500	Male	Red	L

1)Trigger for customer Relation

```

set search_path to "animal_shelter";
create or replace function fun()
returns trigger
language plpgsql
as $body$
begin
    if(new.id in (select id from "animal_shelter".customer)) then
        raise UNIQUE_VIOLATION using message='id already exist';
    end if;

    if(new.email not like '%@_%._%') THEN
        RAISE UNIQUE_VIOLATION USING MESSAGE = 'Email
Not valid ';
    END IF;

    if(new.contact_number>9999999999 or
new.contact_number<1000000000) then
        RAISE UNIQUE_VIOLATION USING MESSAGE = 'contact number is invalid';
    END IF;

    return new;

end
$body$

create trigger t1
before insert
on animal_shelter.customer
for each row
execute procedure fun();

```

27) Insert in customer table which returns a trigger if the customer id already exist in the table

SQL QUERY:

```
INSERT INTO "animal shelter".customer(
id, first_name, last_name, email, address, contact_number)
VALUES (1, 'john', 'wick', 'j_wick@continental.mafia', '16 beckler street
', 9876543210);
```

The screenshot shows the pgAdmin 4 interface with a query editor window. The query is:

```
1 INSERT INTO "animal shelter".customer (
2   id, first_name, last_name, email, address, contact_number)
3 VALUES (1,'john','wick','j_wick@continental.mafia','16 beckler street', 9876543210);
```

The results pane shows an error message:

ERROR: id already exist
CONTEXT: PL/pgSQL function "animal shelter".fun1() line 4 at RAISE
SQL state: 23505

28) Insert into customer table which returns a trigger if email_id is not valid

SQL QUERY:

```
INSERT INTO "animal shelter".customer
    id, first_name, last_name, email, address, contact_number)
VALUES (101 , 'john','wick' , 'j_wick@mafia' , '16 beckler street'
, 9876543210);
```

The screenshot shows the pgAdmin 4 interface. On the left is a tree view of database objects under '201801462_db'. In the center is the 'Query Editor' tab where the SQL query is typed. Below it is the 'Messages' tab, which displays an error message: 'ERROR: Email Not valid' followed by 'CONTEXT: PL/pgSQL function "animal shelter".fun1() line 8 at RAISE SQL state: 23505'. The status bar at the bottom right shows 'Activate Windows' and the date '03-12-2020'.

```
1 INSERT INTO "animal shelter".customer(
2     id, first_name, last_name, email, address, contact_number)
3 VALUES (101 , 'john','wick' , 'j_wick@mafia' , '16 beckler street'
, 9876543210);
```

29) Insert into customer table which returns a trigger if contact number of customer is invalid, (not a 10 digit number)

SQL QUERY:

```
INSERT INTO "animal shelter".customer
    id, first_name, last_name, email, address, contact_number)
VALUES (101,'john','wick','j_wick@mafia.com','16 beckler street',
123456789);
```

The screenshot shows the pgAdmin 4 interface. On the left is a tree view of database objects under 'Tables (11)'. The 'customer' table is selected. In the main pane, there's a 'Query Editor' tab with the following SQL code:

```
1 INSERT INTO "animal shelter".customer(
2     id, first_name, last_name, email, address, contact_number)
3 VALUES (101,'john','wick','j_wick@mafia.com','16 beckler street',
123456789);
```

Below the code, the 'Messages' tab is active, displaying an error message:

ERROR: contact number is invalid
CONTEXT: PL/pgSQL function "animal shelter".fun1() line 12 at RAISE
SQL state: 23505

At the bottom right of the window, there's an 'Activate Windows' message: 'Activate Windows Go to Settings to activate Windows.'

30) Insert into customer table with all valid details which returns the trigger for successful query and add into the customer table

SQL QUERY:

```
INSERT INTO "animal shelter".customer
    id, first_name, last_name, email, address, contact_number)
VALUES (101,'john','wick','j_wick@mafia.com','16 beckler street',
1234567890);
```

The screenshot shows the pgAdmin 4 interface. In the left sidebar, under the 'Tables' section, the 'customer' table is selected. The main pane displays the following SQL code:

```
1 INSERT INTO "animal shelter".customer(
2     id, first_name, last_name, email, address, contact_number)
3 VALUES (101,'john','wick','j_wick@mafia.com','16 beckler street',
4 1234567890);
5 select * from "animal shelter".customer
6
7
```

Below the code, the 'Data Output' tab is active, showing the message: 'Query returned successfully in 72 msec.' A note at the bottom right says 'Activate Windows'.

The screenshot shows the pgAdmin 4 interface. In the left sidebar, under the 'Tables' section, the 'customer' table is selected. The main pane displays the same SQL code as the previous screenshot. Below the code, the 'Data Output' tab is active, showing a table with the following data:

	id	first_name	last_name	email	address	contact_number
1	97	Reinold	Parhouse	rparhouse20@shutterfly.com	5 Charing Cross Hill	3615659147
2	98	Collette	Ulster	culster2p@unicef.org	79 Cordelia Avenue	9931725346
3	99	Tasha	Knapman	tknapman2q@mayoclinic.com	80 Ohio Pass	7745204194
4	100	Eolanda	Emshaw	eemshaw2@mozilla.com	60386 Northview Point	9464793597
5	101	john	wick	j_wick@mafia.com	16 beckler street	1234567890

A note at the bottom right says 'Activate Windows'.

2) Trigger for Adoption Relation

```

set search_path to animal_shelter;
create or replace function fun2()
returns trigger
language plpgsql
as $body$
begin
    if(new.customer_id not in(select id from animal_shelter.customer)) then
        raise UNIQUE_VIOLATION using message='customer id does not exist';
    end if;

    if(new.adoption_info like 'animal') then
        if(new.animal_id in(select adoption.animal_id from
animal_shelter.adoption )) then
            raise UNIQUE_VIOLATION using message='this animal is already
adopted';
        end if;

        if(new.shelter_id != (select shelter_id from animal_shelter.animal
where id =new.animal_id)) then
            raise UNIQUE_VIOLATION using message='this animal does not
exist in this shelter';
        end if;

        return new;
    end if;

    else
        if((select quantity from animal_shelter.pet_accessories where
animal_shelter.pet_accessories.shelter_id=new.shelter_id and
animal_shelter.pet_accessories.item like new.adoption_info) =0)
then
            raise UNIQUE_VIOLATION using message='this item does not exist
in this shelter';
        end if;

        update animal_shelter.pet_accessories set
        quantity=quantity-1
        where animal_shelter.pet_accessories.shelter_id=new.shelter_id
and

```

```
animal_shelter.pet_accessories.item like new.adoption_info ;
end if;
```

```
return new;
```

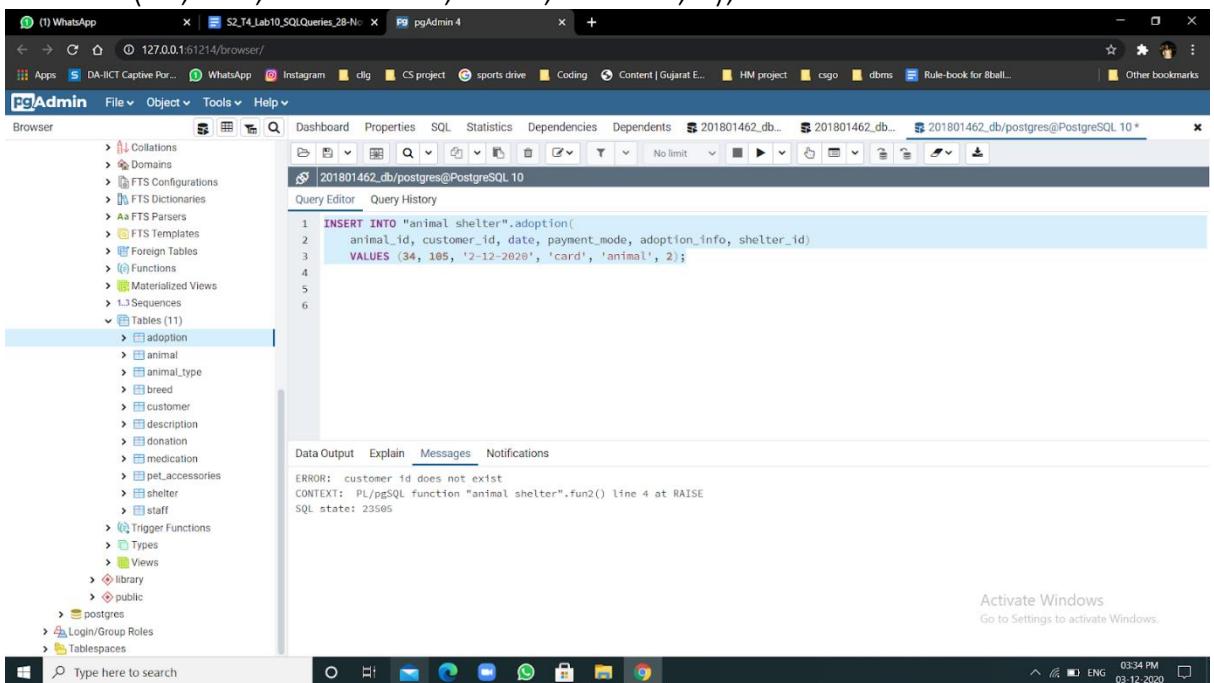

```
end
$body$
```

```
create trigger t2
before insert
on animal_shelter.adoption
for each row
execute procedure fun2();
```

31) Create a trigger for adoption table which checks if the customer wants to adopt then his customer id exist or not in the database

SQL QUERY:

```
INSERT INTO "animal shelter".adoption(
animal_id, customer_id, date, payment_mode, adoption_info, shelter_id)
VALUES (34, 105, '2-12-2020', 'card', 'animal', 2);
```

The screenshot shows the pgAdmin 4 interface. In the center, the Query Editor window displays the following SQL code:

```
1 INSERT INTO "animal shelter".adoption(
2     animal_id, customer_id, date, payment_mode, adoption_info, shelter_id)
3 VALUES (34, 105, '2-12-2020', 'card', 'animal', 2);
```

Below the code, the Data Output tab shows the error message:

ERROR: customer_id does not exist
CONTEXT: PL/pgSQL function "animal shelter".fun2() line 4 at RAISE
SQL state: 23505

32) A customer wants to adopt a pet which is already adopted, returns a trigger with before inserting into adoption table

SQL QUERY:

```
INSERT INTO "animal shelter".adoption(
animal_id, customer_id, date, payment_mode, adoption_info, shelter_id)
VALUES (14, 75, '2-12-2020', 'card', 'animal', 2);
```

The screenshot shows the pgAdmin 4 interface with a query editor window. The query is:

```
1 INSERT INTO "animal shelter".adoption(
2 animal_id, customer_id, date, payment_mode, adoption_info, shelter_id)
3 VALUES (14, 75, '2-12-2020', 'card', 'animal', 2);
4
5
6
```

In the results pane, an error message is displayed:

ERROR: this animal is already adopted
CONTEXT: PL/pgSQL function "animal shelter".fun2() line 9 at RAISE
SQL state: 23505

The pgAdmin interface includes a sidebar with database objects like Collations, Domains, FTS Configurations, etc., and a toolbar with various icons.

33) A customer wants to adopt a pet which is not present in the given shelter, return a trigger doing the same.

SQL QUERY:

```
INSERT INTO "animal shelter".adoption(
animal_id, customer_id, date, payment_mode, adoption_info, shelter_id)
VALUES (3, 75, '2-12-2020', 'card', 'animal', 4);
```

The screenshot shows the pgAdmin 4 interface with a query editor window. The query is:

```
1 INSERT INTO "animal shelter".adoption(
2 animal_id, customer_id, date, payment_mode, adoption_info, shelter_id)
3 VALUES (3, 75, '2-12-2020', 'card', 'animal', 4);
```

The results pane displays an error message:

ERROR: this animal does not exist in this shelter
CONTEXT: PL/pgSQL Function "animal shelter.fun2()" line 13 at RAISE
SQL state: 23505

The pgAdmin interface includes a sidebar with database objects like Tables (11), a top navigation bar with browser tabs, and a system tray at the bottom.

34) A customer wants to buy a pet accessory from a shelter but that item is not present in the shelter, return a trigger for the same.

SQL QUERY:

```
INSERT INTO "animal shelter".adoption(
animal_id, customer_id, date, payment_mode, adoption_info, shelter_id)
VALUES (NULL, 75, '2-12-2020', 'card', 'cage', 2);
```

The screenshot shows the pgAdmin 4 interface with a query editor window. The query is:

```
1 INSERT INTO "animal shelter".adoption(
2 animal_id, customer_id, date, payment_mode, adoption_info, shelter_id)
3 VALUES (NULL, 75, '2-12-2020', 'card', 'cage', 2);
4
5
6
```

The 'Messages' tab displays an error message:

ERROR: this item does not exist in this shelter
CONTEXT: PL/pgSQL Function "animal shelter".fun2() line 22 at RAISE
SQL state: 23505

The pgAdmin interface includes a sidebar with database objects like 'Tables (11)', 'Functions', and 'Views'. The status bar at the bottom right shows system information: 03:45 PM, ENG, 09-12-2020.

35) Customer wants to buy any pet accessories from the shelter, create a trigger which decreases the quantity after every adoption/buy of pet accessories

SQL QUERY:

```
INSERT INTO "animal shelter".adoption(
animal_id, customer_id, date, payment_mode, adoption_info, shelter_id)
VALUES (NULL, 75, '2-12-2020', 'card', 'cage', 1);
```

//before running above query quantity of cage in shelter 1:

The screenshot shows the pgAdmin 4 interface with the '201801462_db/postgres@PostgreSQL 10' connection selected. In the left sidebar, under 'Tables (11)', the 'pet_accessories' table is selected. In the main pane, the 'Query Editor' contains the following SQL code:

```
1 INSERT INTO "animal shelter".adoption(
2 animal_id, customer_id, date, payment_mode, adoption_info, shelter_id)
3 VALUES (NULL, 75, '2-12-2020', 'card', 'cage', 1);
4
5
6 select * from "animal shelter".pet_accessories
```

Below the code, the 'Data Output' tab is active, showing a table with the following data:

shelter_id	item	quantity	price
1	food packets	7	500
2	belts	12	450
3	cage	7	1000
4	medicines	16	200
5	food packets	16	500
6	belts	18	450

The screenshot shows the pgAdmin 4 interface with the same connection. The 'pet_accessories' table is still selected in the left sidebar. In the main pane, the 'Query Editor' contains the same SQL code as the previous screenshot.

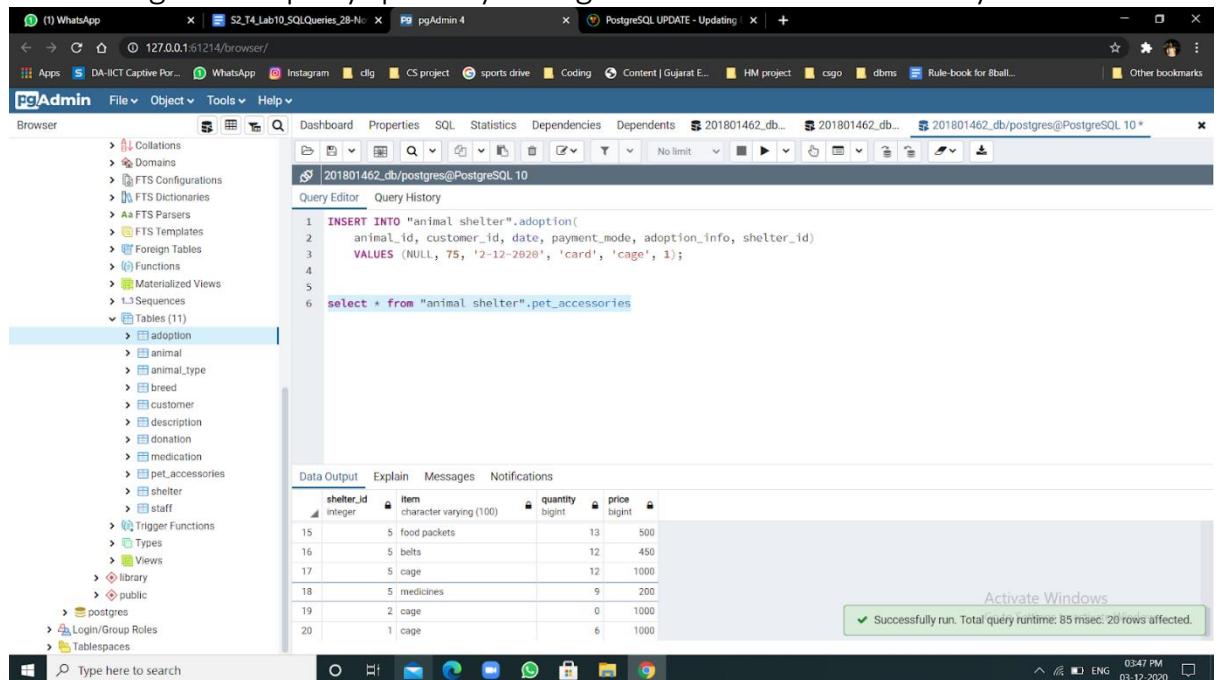

Below the code, the 'Messages' tab is active, displaying the message:

INSERT 0 1

Query returned successfully in 177 msec.

A green notification bar at the bottom right of the pgAdmin window says: 'Query returned successfully in 177 msec.'

///after running above query quantity of cage in shelter 1 decreases by 1:

The screenshot shows the pgAdmin 4 interface with a query editor window. The query executed was:

```

1 INSERT INTO "animal shelter".adoption(
2     animal_id, customer_id, date, payment_mode, adoption_info, shelter_id)
3     VALUES (NULL, 75, '2-12-2020', 'card', 'cage', 1);
4
5
6 select * from "animal shelter".pet_accessories

```

The Data Output tab displays the results of the SELECT query:

shelter_id	item	quantity	price
15	food packets	13	500
16	belts	12	450
17	cage	12	1000
18	medicines	9	200
19	cage	0	1000
20	cage	6	1000

A green message bar at the bottom right indicates: "Successfully run. Total query runtime: 85 msec. 20 rows affected."

36) Customer adopts a pet with all valid entries, return a trigger for the same

SQL QUERY:

```
INSERT INTO "animal shelter".adoption(
animal_id, customer_id, date, payment_mode, adoption_info, shelter_id)
VALUES (33, 15, '2-12-2020', 'cash', 'animal', 3);
```

```
1 INSERT INTO "animal shelter".adoption(
2 animal_id, customer_id, date, payment_mode, adoption_info, shelter_id)
3 VALUES (33, 15, '2-12-2020', 'cash', 'animal', 3);
4
5
6
```

Activate Windows

3) Trigger for Donation Relation

```

set search_path to animal_shelter;
create or replace function fun3()
returns trigger
language plpgsql
as $body$
begin
    if(new.customer_id not in(select id from animal_shelter.customer)) then
        raise UNIQUE_VIOLATION using message='customer id does not exist';
    end if;

    if(new.donation_info like 'animal') then
        if(new.animal_id not in (select id from animal_shelter.animal))
then
            raise UNIQUE_VIOLATION using message='please enter the animal
details first';
        end if;

        if(new.animal_id in (select animal_id from
animal_shelter.donation)) then
            raise UNIQUE_VIOLATION using message='enter valid animal id';
        end if;

        if(new.animal_id in (select animal_id from
animal_shelter.adoption)) then
            raise UNIQUE_VIOLATION using message='input is invalid: this
animal is adopted';
        end if;

        if(new.shelter_id != (select shelter_id from animal_shelter.animal
where id =new.animal_id)) then
            raise UNIQUE_VIOLATION using message='input is invalid :this
animal does not exist in this shelter';
        end if;

    return new;
else
    if(new.animal_id is not null) then

```

```
raise UNIQUE_VIOLATION using message='for donation of pet
accessories animal id should be NULL';
end if;

update animal_shelter.pet_accessories set
quantity=quantity+1
where animal_shelter.pet_accessories.shelter_id=new.shelter_id
and
animal_shelter.pet_accessories.item like new.donation_info ;

return new;
end if;
end
$body$
```

```
create trigger t3
before insert
on animal_shelter.donation
for each row
execute procedure fun3();
```

Queries:

37) A customer wants to donate in our shelter, return a trigger if that customer with given id exists or not.

SQL QUERY:

```
INSERT INTO "animal shelter".donation(
animal_id, customer_id, donation_info, date, shelter_id)
VALUES (102, 110, 'animal', '2-12-2020', 2);
```

The screenshot shows the pgAdmin 4 interface. On the left is a tree view of database objects under the 'Tables (11)' section, with 'donation' selected. The main window contains a 'Query Editor' tab with the following SQL code:

```
1 INSERT INTO "animal shelter".donation(
2     animal_id, customer_id, donation_info, date, shelter_id)
3 VALUES (102, 110, 'animal', '2-12-2020', 2);
```

Below the code, an 'ERROR' message is displayed:

ERROR: customer_id does not exist
CONTEXT: PL/pgSQL function "animal shelter".fun3() line 4 at RAISE

26	101	23 animal	2-12-2020	1

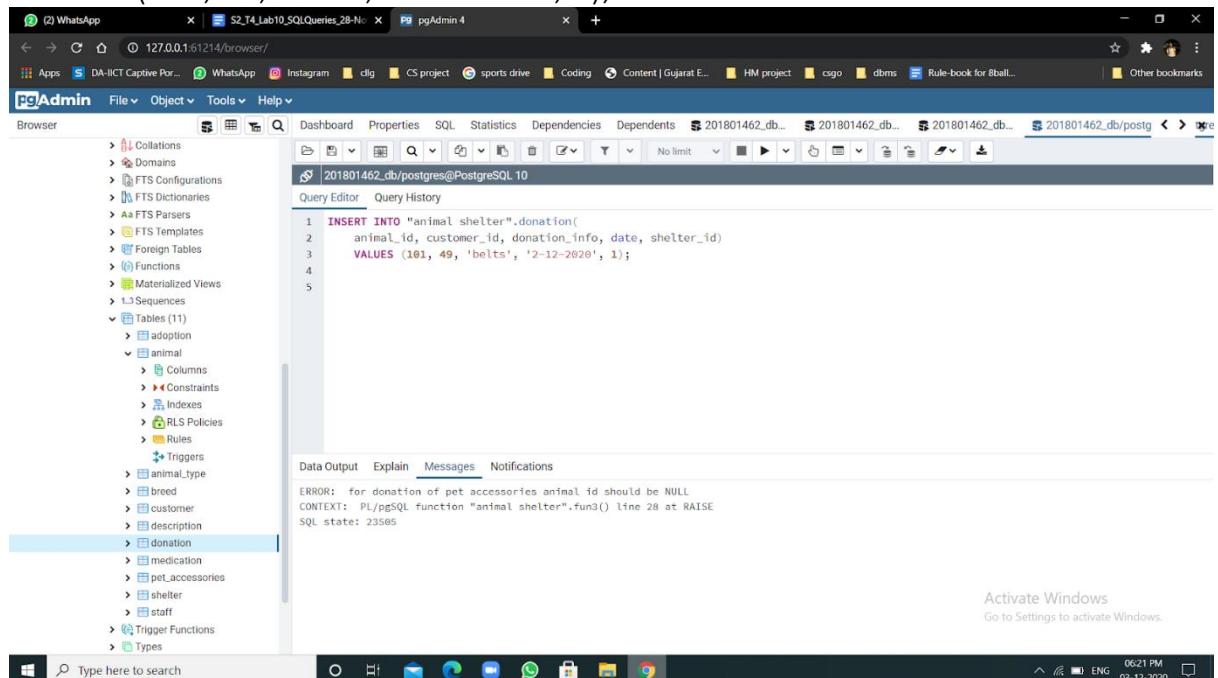

41) A customer wants to donate a pet accessory, he filled the animal id col during application, return a trigger for the same.

SQL:

```

INSERT INTO "animal shelter".donation(
    animal_id, customer_id, donation_info, date, shelter_id)
VALUES (101, 49, 'belts', '2-12-2020', 1);

```

```

1 INSERT INTO "animal shelter".donation(
2     animal_id, customer_id, donation_info, date, shelter_id)
3     VALUES (101, 49, 'belts', '2-12-2020', 1);
4
5

```

ERROR: for donation of pet accessories animal id should be NULL
CONTEXT: PL/pgSQL function "animal shelter".fun3() line 28 at RAISE
SQL state: 23508

42) A customer wants to donate a pet accessory, write a trigger fun to check for valid details and increment the accessory in the pet accessory table

SQL QUERY:

```
INSERT INTO "animal shelter".donation(
animal_id, customer_id, donation_info, date, shelter_id)
VALUES (NULL, 49, 'belts', '2-12-2020', 1);
```

```
select * from "animal shelter".pet_accessories
```

//before running the query, quantity of belts in shelter 1

The screenshot shows the pgAdmin 4 interface. On the left is a tree view of database objects under 'Tables (11)'. In the center is the 'Query Editor' tab with the following SQL code:

```
1 INSERT INTO "animal shelter".donation(
2     animal_id, customer_id, donation_info, date, shelter_id)
3     VALUES (NULL, 49, 'belts', '2-12-2020', 1);
4
5 select * from "animal shelter".pet_accessories
```

Below the code, the 'Data Output' tab shows the result of the query:

```
INSERT 0 1
Query returned successfully in 282 msec.
```

A green message bar at the bottom right says: 'Activate Windows' and '✓ Query returned successfully in 282 msec.'

The screenshot shows the pgAdmin 4 interface with a query editor window titled '201801462_db/postgres@PostgreSQL 10'. The query is:

```

1 INSERT INTO "animal shelter".donation(
2     animal_id, customer_id, donation_info, date, shelter_id)
3     VALUES (NULL, 49, 'belts', '2-12-2020', 1);
4
5 select * from "animal shelter".pet_accessories

```

The results table has columns: shelter_id, item, quantity, price. The data is:

shelter_id	item	quantity	price
1	food packets	7	500
2	belts	12	450
3	medicines	16	200
4	food packets	16	500
5	belts	18	450
6	medicines	19	200
7	food packets	15	500

A message bar at the bottom right says 'Activate Windows'.

////after running the query, quantity of belts in shelter 1 increased by 1

The screenshot shows the pgAdmin 4 interface with a query editor window titled '201801462_db/postgres@PostgreSQL 10'. The query is identical to the one in the previous screenshot:

```

1 INSERT INTO "animal shelter".donation(
2     animal_id, customer_id, donation_info, date, shelter_id)
3     VALUES (NULL, 49, 'belts', '2-12-2020', 1);
4
5 select * from "animal shelter".pet_accessories

```

The results table now has an additional row (row 20) for 'belts' with a quantity of 13. The data is:

shelter_id	item	quantity	price
14	food packets	7	500
15	belts	12	450
16	cage	12	1000
17	medicines	9	200
18	cage	0	1000
19	cage	6	1000
20	belts	13	450

A message bar at the bottom right says 'Successfully run. Total query runtime: 73 msec. 2'.

4) animal trigger

```

set search_path to animal_shelter;
create or replace function fun4()
returns trigger
language plpgsql
as $body$
begin
    if(new.id in (select id from animal_shelter.animal)) then
        raise UNIQUE_VIOLATION using message='input invalid:animal id already
exist';
    end if;

    if(new.type not in (select id from animal_shelter.animal_type)) then
        raise UNIQUE_VIOLATION using message='input invalid:animal type does
not exist';
    end if;

    if(new.shelter_id not in( select id from animal_shelter.shelter)) then
        raise UNIQUE_VIOLATION using message='input invalid:shelter does not
exist';
    end if;

    if(new.type = 1 ) then
        if(new.breed_type <1 or new.breed_type>6 ) then
            raise UNIQUE_VIOLATION using message='input invalid: animal
type and breed are not matching';
        end if;
    end if;

    if(new.type = 2) then
        if(new.breed_type <7 or new.breed_type>11 ) then
            raise UNIQUE_VIOLATION using message='input invalid: animal
type and breed are not matching';
        end if;
    end if;

    if(new.type = 3) then
        if(new.breed_type <12 or new.breed_type>16 ) then

```

```
        raise UNIQUE_VIOLATION using message='input invalid: animal
type and breed are not matching';
        end if;
    end if;

    if(new.type = 4) then
        if(new.breed_type <17 or new.breed_type>21 ) then
            raise UNIQUE_VIOLATION using message='input invalid: animal
type and breed are not matching';
        end if;
    end if;

    return new;

end
$body$
```

```
create trigger t4
before insert
on animal_shelter.animal
for each row
execute procedure fun4();
```

Queries:

43) A new entry of animal is being done, return a trigger if animal id exists in the database

SQL QUERY:

```
INSERT INTO "animal shelter".animal(
    id, shelter_id, type, breed_type, age, rate, gender, colour, cage_size,
    height, weight)
VALUES (1, 1, 1, 1, 4, 2500, 'Male', 'Brown', 'L', 120, 25);
```

The screenshot shows the pgAdmin 4 interface. On the left is a tree view of database objects under the 'Tables (11)' section, with 'animal' selected. In the center is the 'Query Editor' tab where the provided SQL code was run. Below the editor are tabs for 'Data Output', 'Explain', 'Messages', and 'Notifications'. The 'Messages' tab displays an error message:

```
1 INSERT INTO "animal shelter".animal(
2     id, shelter_id, type, breed_type, age, rate, gender, colour, cage_size,
3     height, weight)
4 VALUES (1, 1, 1, 1, 4, 2500, 'Male', 'Brown', 'L', 120, 25);

ERROR: input invalid:animal id already exist
CONTEXT: PL/pgSQL function "animal shelter".fun4() line 4 at RAISE
SQL state: 23505
```

The status bar at the bottom right shows the date and time: 03-12-2020 06:31 PM.

44) Insert in animal table, return trigger if input is not valid

SQL QUERY:

```
INSERT INTO "animal shelter".animal(
    id, shelter_id, type, breed_type, age, rate, gender, colour, cage_size,
    height, weight)
VALUES (105, 6, 1, 1, 4, 2500, 'Male', 'Brown', 'L', 120, 25);
```

The screenshot shows the pgAdmin 4 interface with a query editor window. The query is:

```
1 INSERT INTO "animal shelter".animal(
2     id, shelter_id, type, breed_type, age, rate, gender, colour, cage_size,
3     height, weight)
VALUES (105, 6, 1, 1, 4, 2500, 'Male', 'Brown', 'L', 120, 25);
```

The output pane displays an error message:

ERROR: input invalid:shelter does not exist
CONTEXT: PL/pgSQL function "animal shelter".fun4() line 12 at RAISE
SQL state: 23505

The pgAdmin interface includes a sidebar with database and schema navigation, and a bottom status bar showing system information.

45) animal type id out of range

SQL QUERY:

```
INSERT INTO "animal shelter".animal(
id, shelter_id, type, breed_type, age, rate, gender, colour, cage_size,
height, weight)
VALUES (105, 3, 6, 1, 4, 2500, 'Male', 'Brown', 'L', 120, 25);
```

46) animal type id must be in range of breed

SQL QUERY:

```
INSERT INTO "animal shelter".animal(
    id, shelter_id, type, breed_type, age, rate, gender, colour, cage_size,
    height, weight)
```

```
VALUES (105, 3, 3, 21, 4, 2500, 'Male', 'Brown', 'L', 120, 25);
```

The screenshot shows the pgAdmin 4 interface with a query editor window. The query is:

```
1 INSERT INTO "animal shelter".animal(
2     id, shelter_id, type, breed_type, age, rate, gender, colour, cage_size,
3     height, weight)
4 VALUES (105, 3, 3, 21, 4, 2500, 'Male', 'Brown', 'L', 120, 25);
```

The results pane displays an error message:

ERROR: input invalid: animal type and breed are not matching
CONTEXT: PL/pgSQL function "animal shelter".fun4() line 29 at RAISE
SQL state: 23505

The pgAdmin interface includes a sidebar with a tree view of database objects, a toolbar with various icons, and a system tray at the bottom.

47) Animal is being add, return a trigger and insert in all entries are valid

SQL:

```
INSERT INTO "animal shelter".animal(
    id, shelter_id, type, breed_type, age, rate, gender, colour, cage_size,
    height, weight)
VALUES (105, 3, 2, 9, 4, 2500, 'Female', 'Brown', 'L', 25.5, 22.5);
```

```
select * from "animal shelter".animal
```

```
201801462_db/postgres@PostgreSQL 10
Query Editor Query History
1 INSERT INTO "animal shelter".animal(
2     id, shelter_id, type, breed_type, age, rate, gender, colour, cage_size,
3     height, weight)
4 VALUES (105, 3, 2, 9, 4, 2500, 'Female', 'Brown', 'L', 25.5, 22.5);
5
6 select * from "animal shelter".animal

```

	id	shelter_id	type	breed_type	age	rate	gender	colour	cage_size	height
98	98	1	4	18	6	2000	Female	Green	M	
99	99	4	3	14	13	2300	Male	Yellow	L	
100	100	3	1	3	3	3900	Male	Brown	XL	
101	101	1	1	1	4	2200	Male	White	M	
102	105	3	2	9	4	2500	Female	Brown		

48) Print the name of customer with most donations

SQL QUERY:

```
create view max_donation(id ,count ) as
select customer_id,count(*)
from donation group by customer_id
order by count desc
limit 1
```

```
select * from max_donation
```

```
select customer.first_name,last_name from customer
where customer.id =
(select id from max_donation)
```

The screenshot shows the pgAdmin 4 interface with a query editor window open. The browser pane on the left lists database objects like breed, customer, donation, medication, pet.accessories, shelter, and staff. The query editor contains the following SQL code:

```

1 create view max_donation(id ,count ) as
2 select customer_id,count(*)
3 from donation group by customer_id
4 order by count desc
5 limit 1
6
7 select * from max_donation
8
9 select customer.first_name,last_name from customer
10 where customer.id =
11 (select id from max_donation)
12 |

```

The results pane shows the output of the final query, which is a single row:

first_name	last_name
Hector	De Vuyst
